

HR Employee Churn System

Problem Statement:- Number of employees who leave your organization over a specific period.

Executive Summary

The overall employee churn rate is 16.1%, meaning 237 out of 1470 employees left the company. The data reveals that churn is not evenly distributed and is heavily influenced by specific job roles, departments, and salary levels.

Key Insights

1. Job Role is the Biggest Predictor of Churn:

- Laboratory Technicians are the most likely to leave (62 churns), followed closely by Sales Executives (57 churns) and Research Scientists (47 churns).
- Managers, Research Directors, and Healthcare Representatives have very low churn rates, indicating high retention in these roles.

2. Departmental Impact:

- The Research & Development department has the highest volume of churn (as it contains Lab Technicians and Scientists).
- The Sales department also shows significant churn.
- Human Resources has relatively low churn (12).

3. Salary is a Major Factor:

- The vast majority of employees who churn (163 out of 237) are in the lowest salary bracket (Up to 5k). This is a very strong indicator that compensation is a primary driver for employees leaving.
- Churn decreases significantly as salary increases.

4. Employee Satisfaction is Alarmingly Low:

- The satisfaction rate for employees who churned is very poor. A staggering ~70% of leavers had a low satisfaction rating (1 or 2 out of 4).
- Only ~32% of leavers were somewhat satisfied (rating 3 or 4). This clearly links low job satisfaction to the decision to leave.

5. Other Demographic Factors:

- Gender: Churn is slightly higher among Males, but the difference is not drastic.
- Tenure: The average company tenure for those who churn is 7 years, suggesting employees are leaving after gaining significant experience.

Recommendations for Action

- Review Compensation: Immediately investigate and address the compensation packages for Laboratory Technicians, Sales Executives, and Research Scientists, especially those in the lowest pay bracket.
- Conduct Exit Interviews: Focus on the high-churn roles and low-satisfaction employees to understand the root causes (e.g., workload, management, career growth).
- Targeted Retention Programs: Develop role-specific retention strategies for the high-risk groups identified, which could include career pathing, bonus structures, or improved working conditions.
- Improve Engagement: Implement measures to improve job satisfaction, particularly for employees in the first few years and those in the highlighted high-churn roles.

This data provides a clear roadmap for where to focus HR efforts to most effectively reduce employee turnover.
